

# Evaluating The Suitability of GEDI-derived Structural Vegetation Information Metrics For Characterization of Savannah Ecosystems in Southern Africa

Author: Chidinma Akah

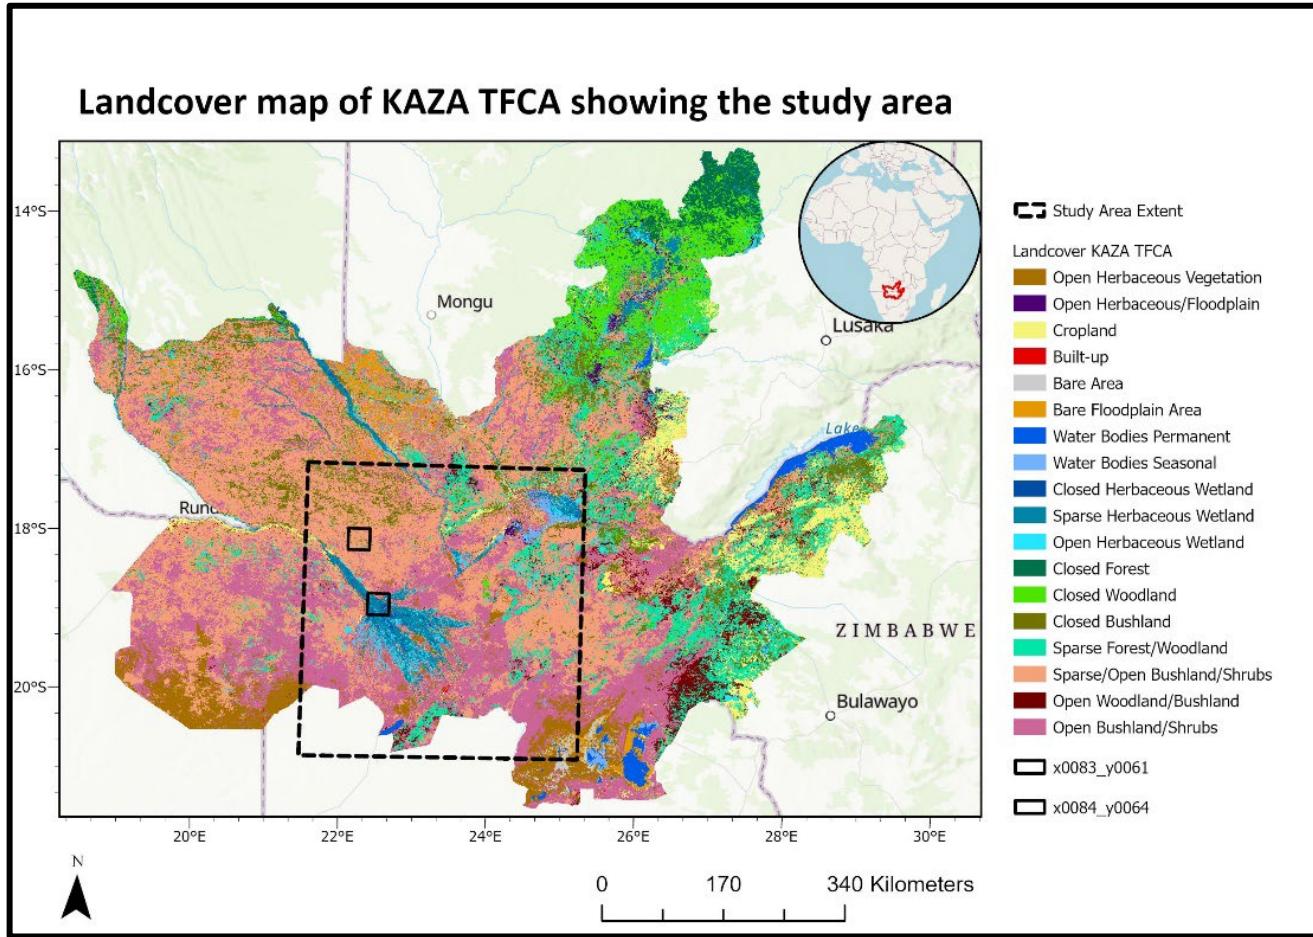

Co-Authors: Achim Röder, Jari Mahler, Thomas Udelhoven

Presenter: Jari Mahler

Department of Environmental Remote Sensing & Geoinformatics,  
Fac. Of Regional and Environmental Sciences  
Trier University, Germany

# KAZA and Okavango Delta

Land cover map of KAZA TFCA (Gebhardt, S. 2021).

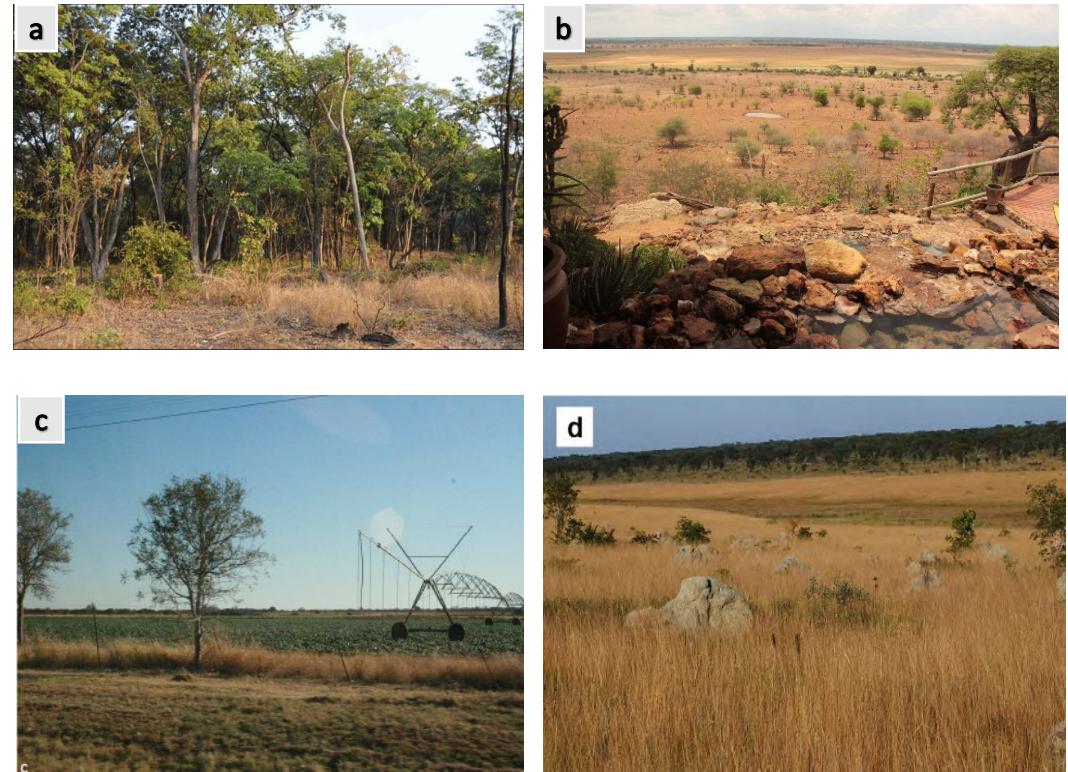

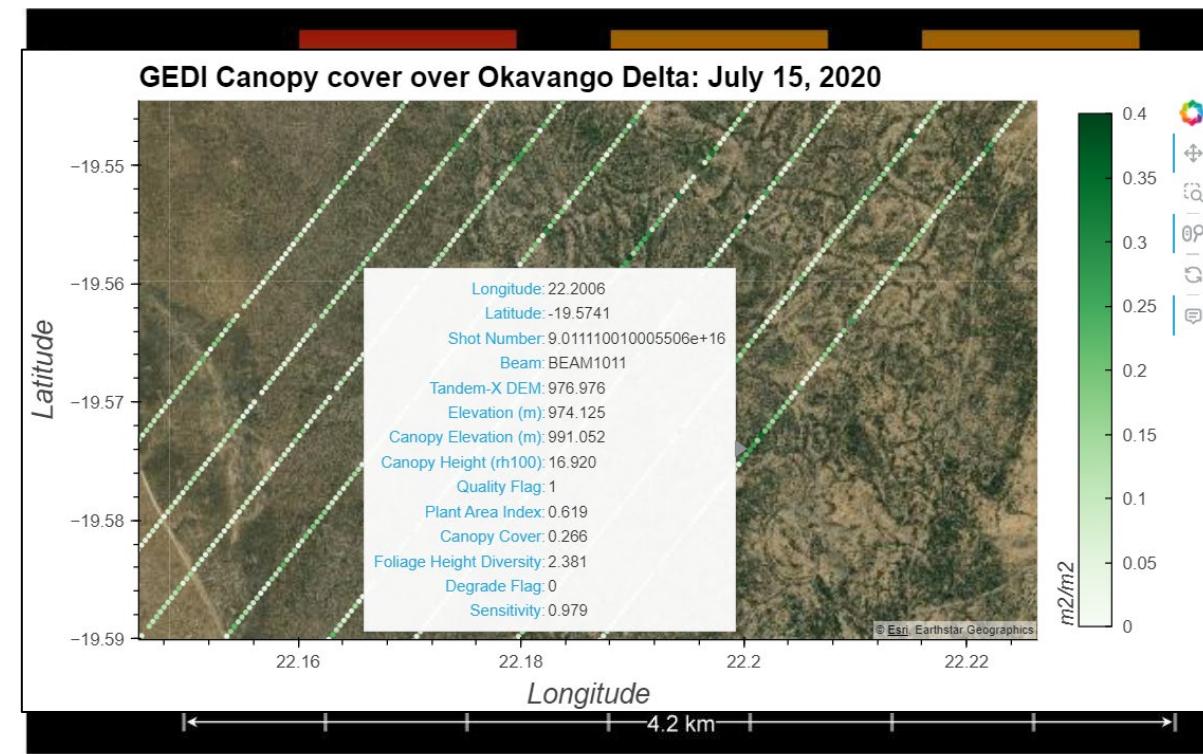

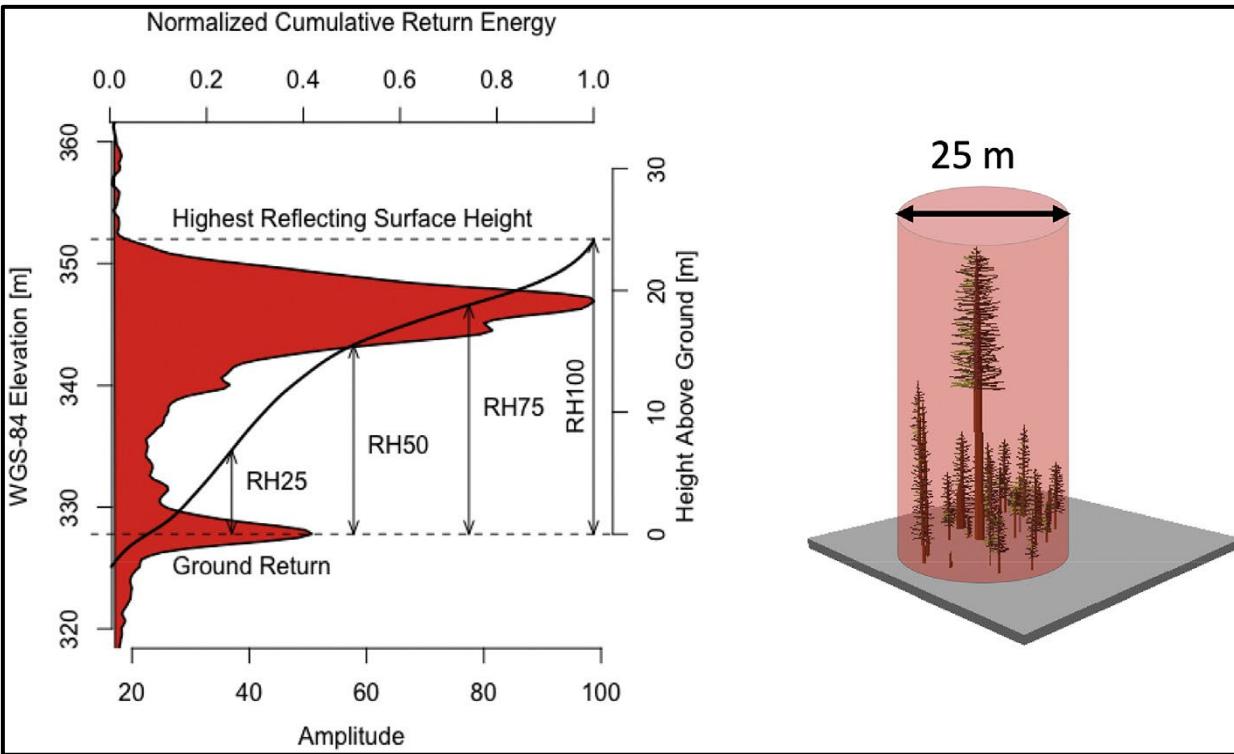

Figure 1. Vegetation types in the study area.  
a) woodlands b) open shrubland, c) cropland, d) grassland with closed forest to the left

# Global Ecosystem Dynamics Investigation (GEDI)

- Vertical structural vegetation data
- 25m diameter footprint
- Canopy height - RH98
- Canopy cover
- Foliage height diversity (FHD)
- Plant area index (PAI)
- Launched in 2018
- 2019-2022 data used in this study
- Each overpass 4 tracks
- Sparse coverage (60m, 600m apart)
- Geolocation uncertainty of ~10m (Tang, et al., 2023)

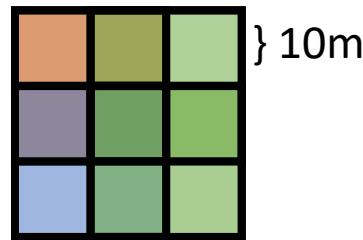

# Sentinel-2 STM, Phenology

## Why Sentinel-2?

### Sentinel-2 Raster Data

13 reflectance bands

10m (partly resampled)

### Spectral Temporal Metrics (STM)

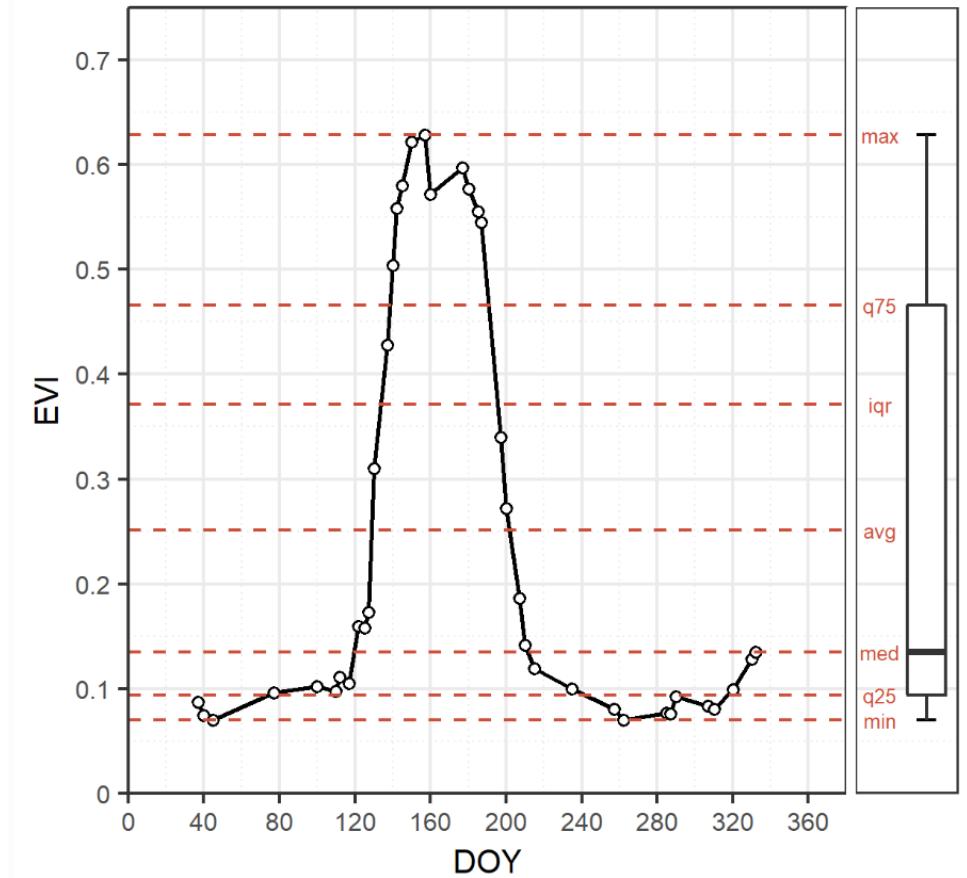

Statistical aggregation of time series (2019-2022)

Q10, Q25, median, Q75, Q90, AVG, STD

### Phenology Parameters

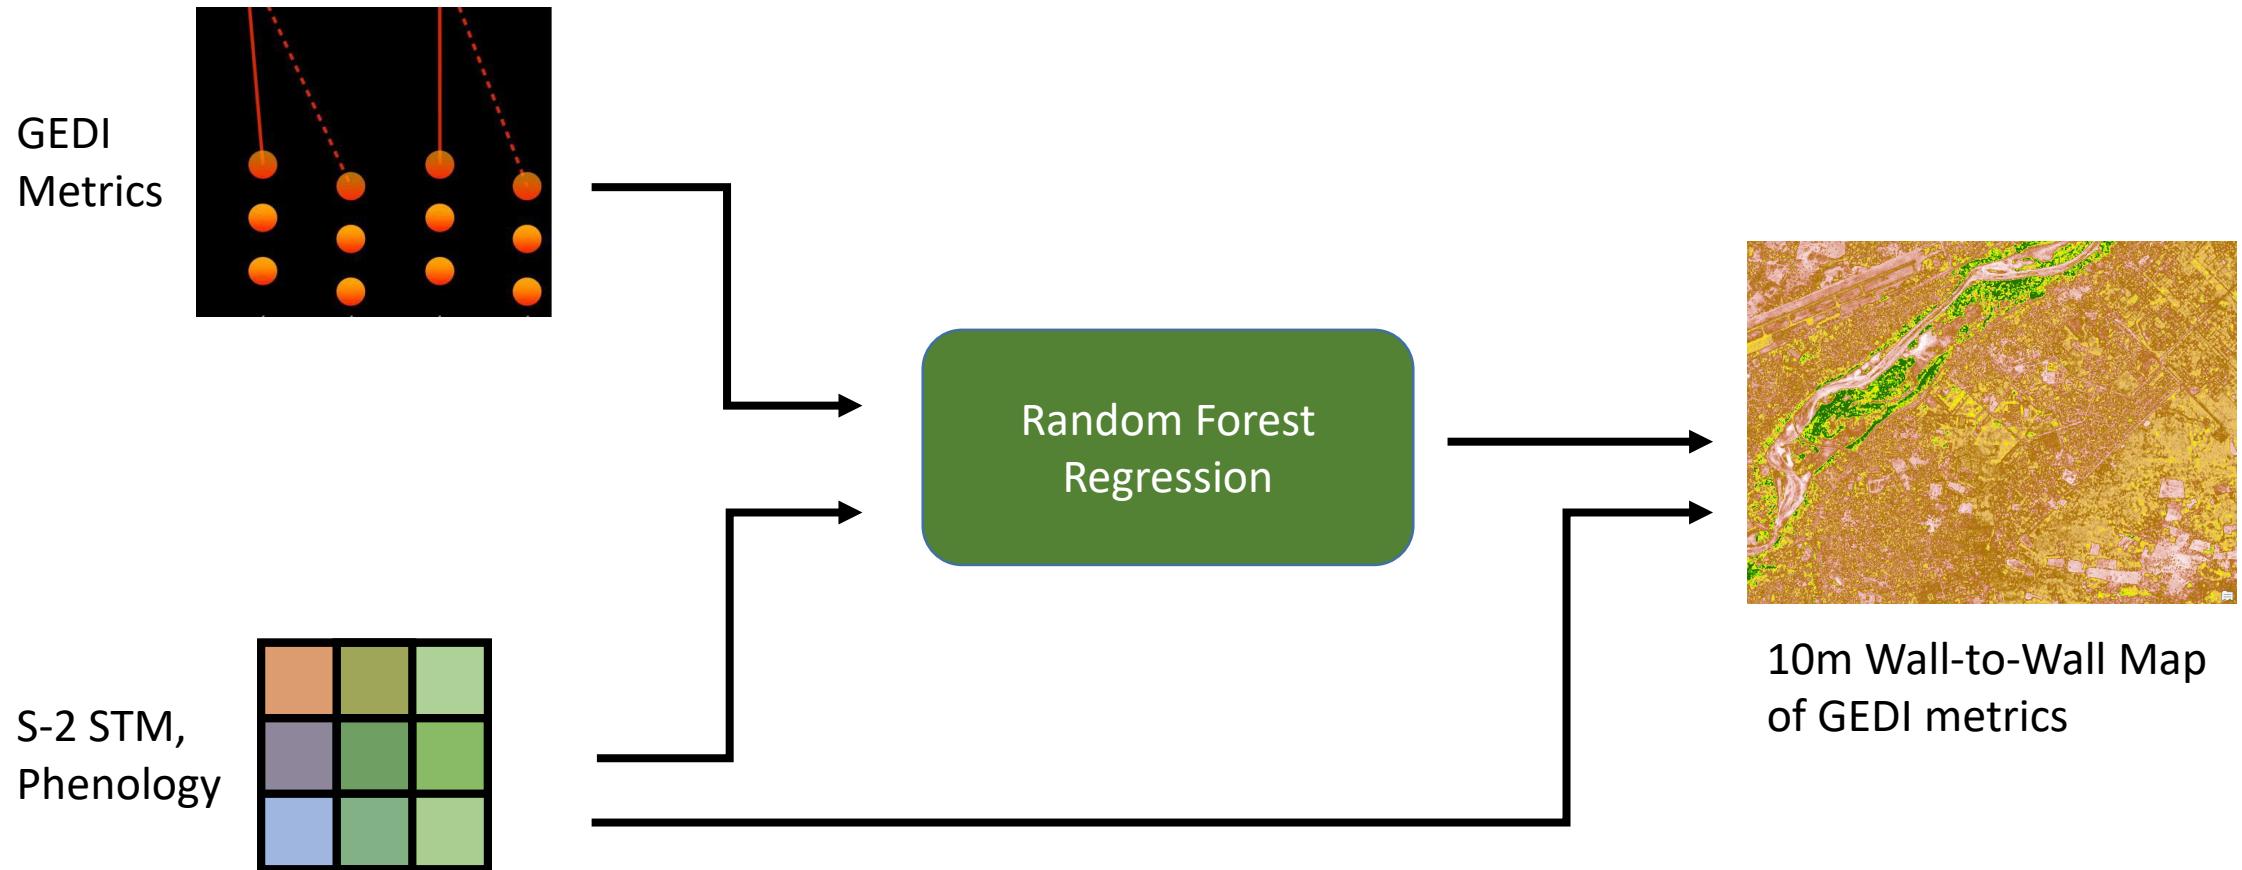

Description of EVI phenology curve

E.g. Area under the curve, Date/Value Peak of Season

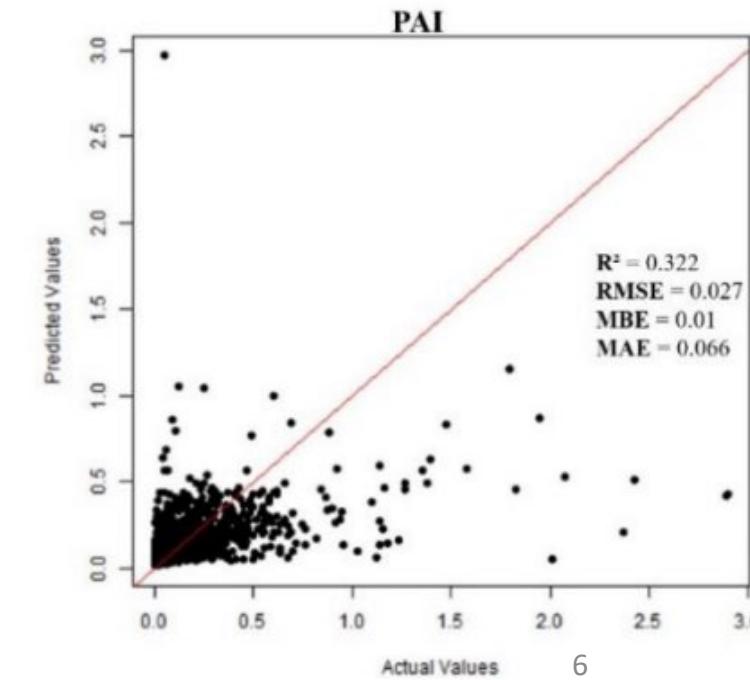

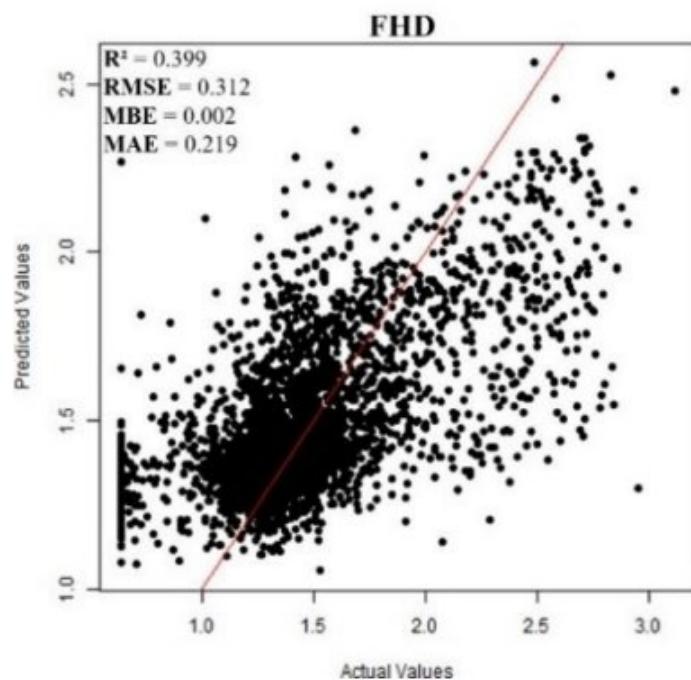

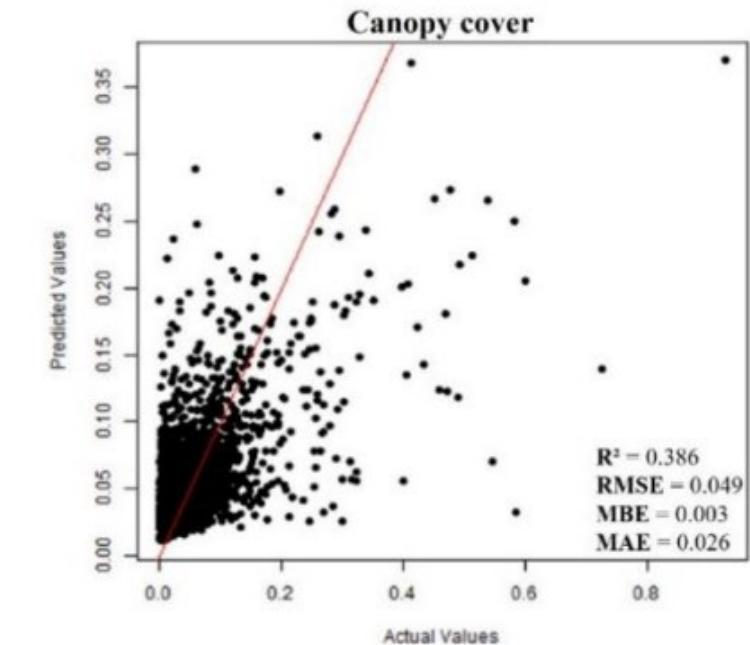

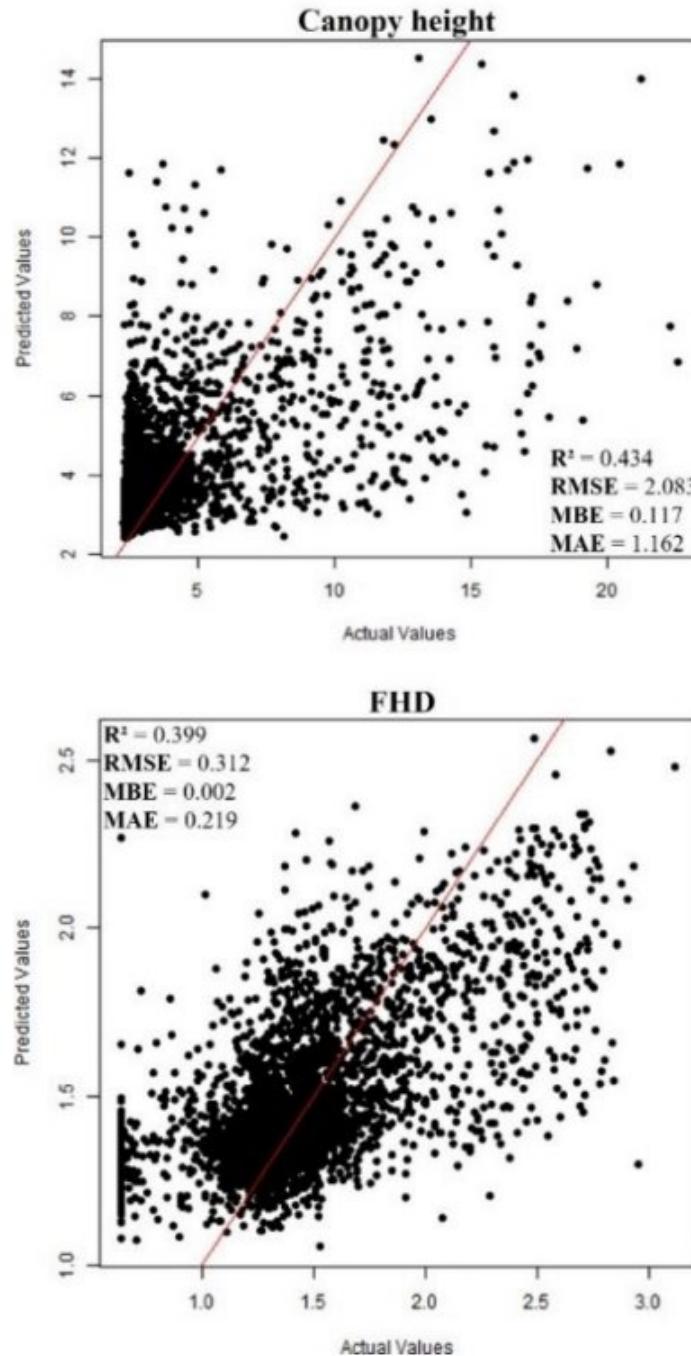

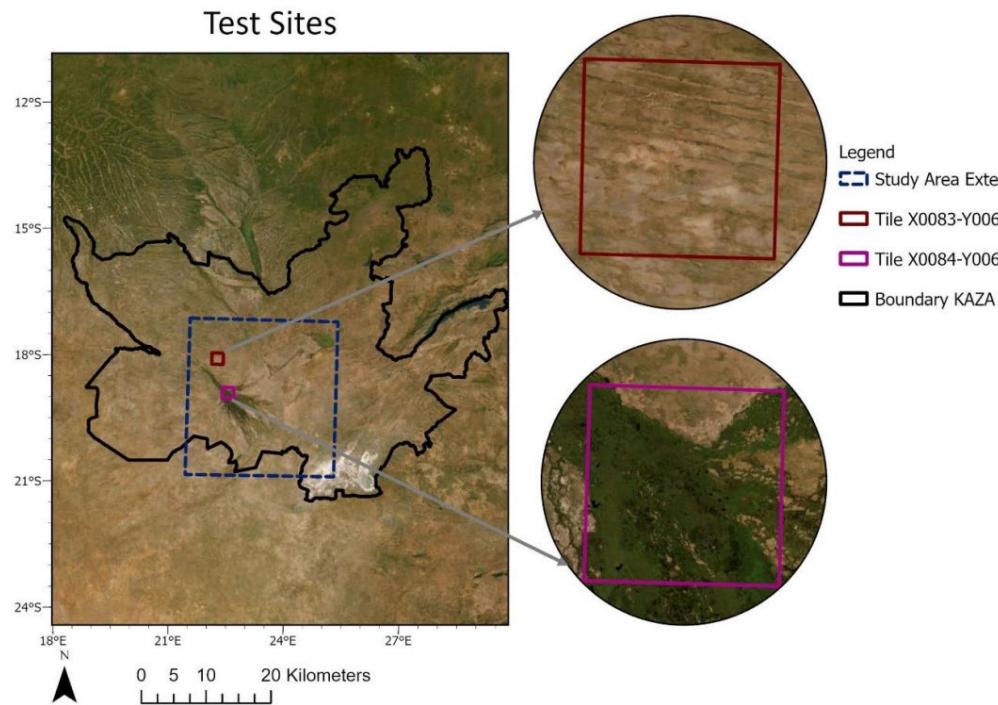

STM concept © Stefan Ernst

# Random Forest Model

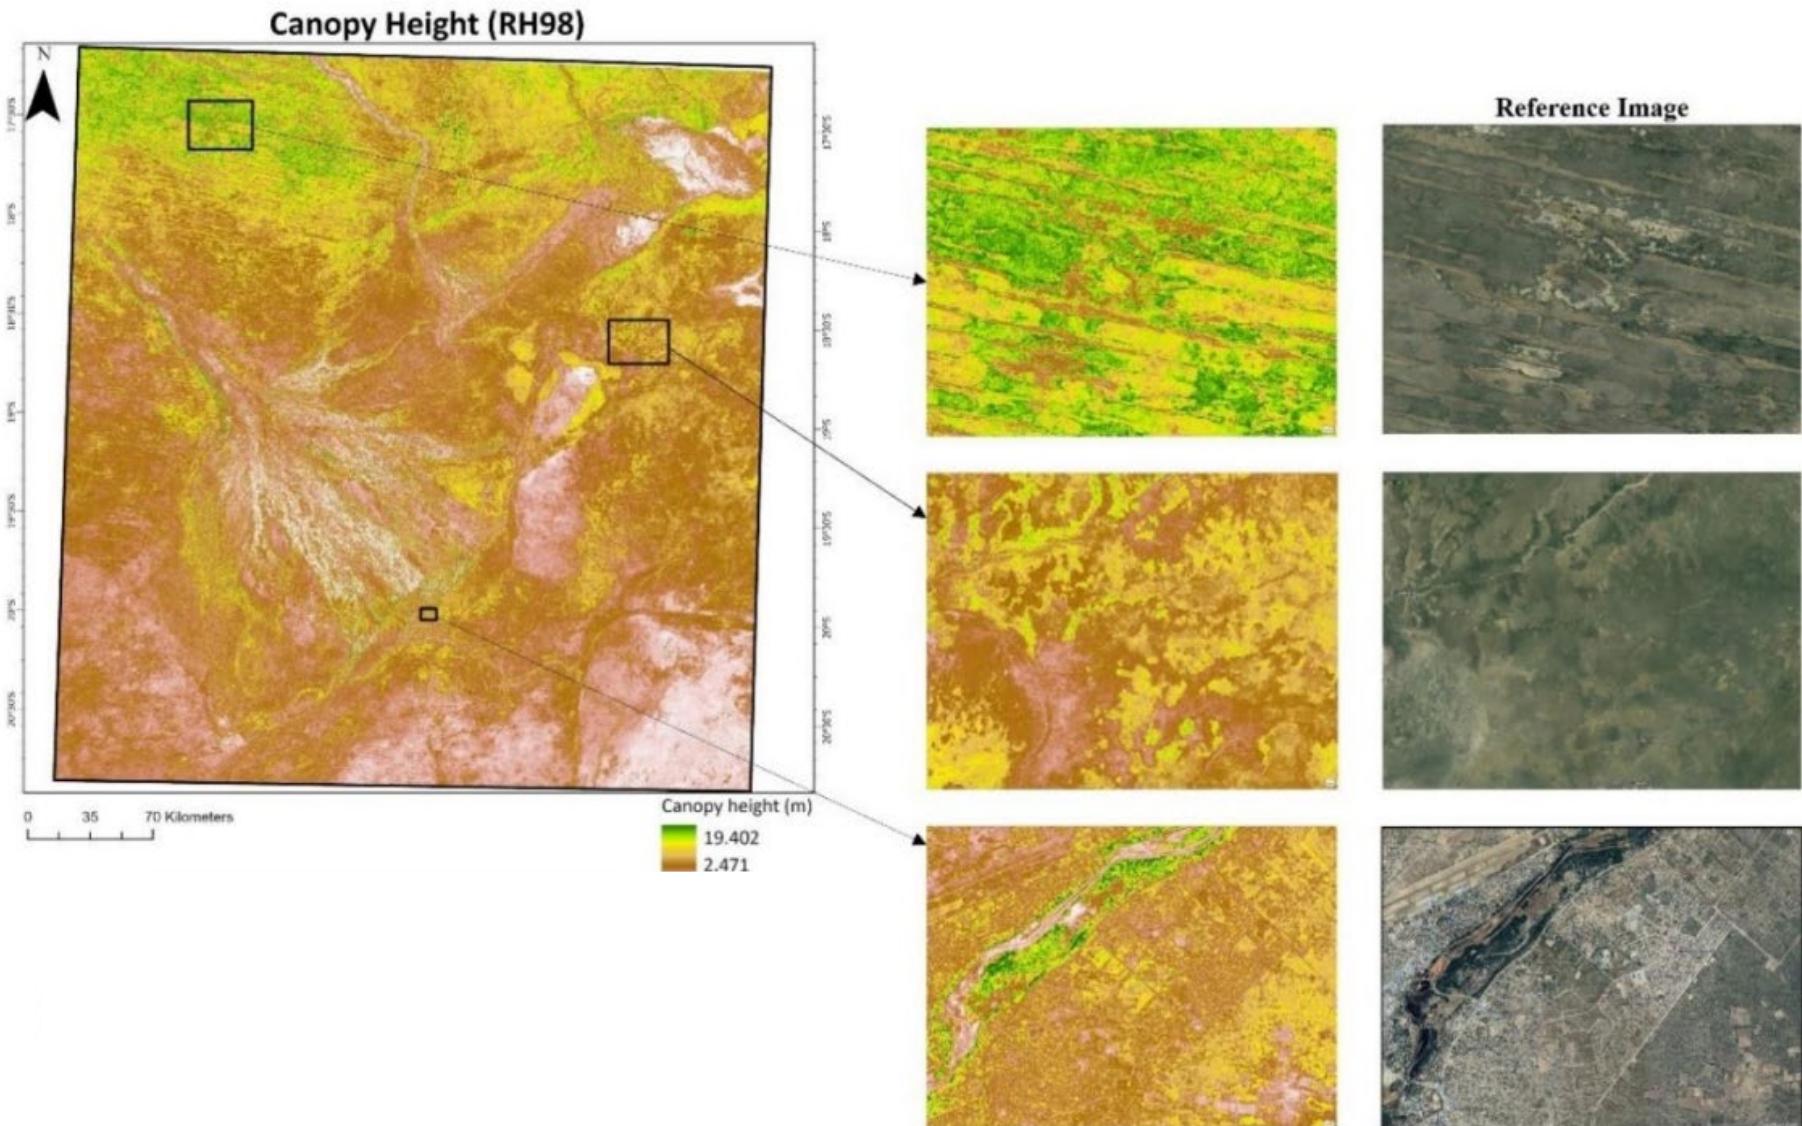

# Accuracy Test Tiles

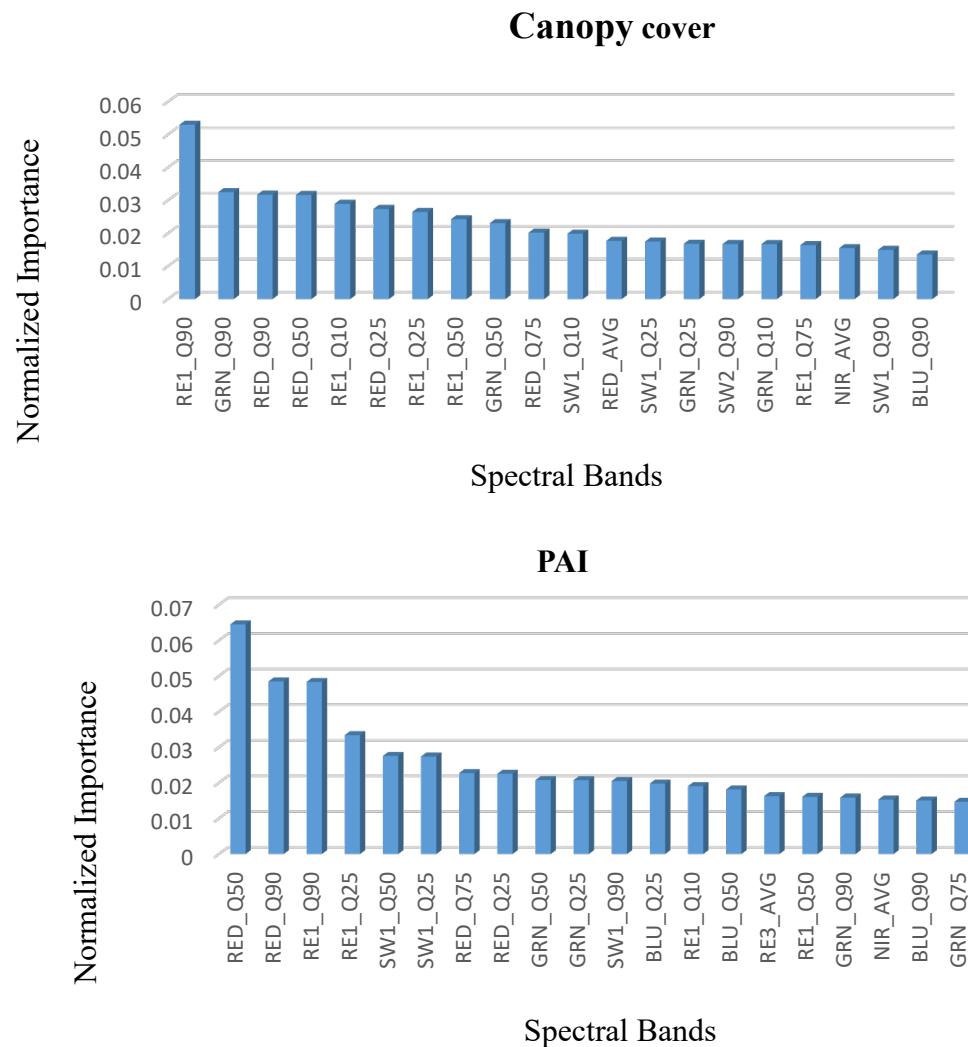

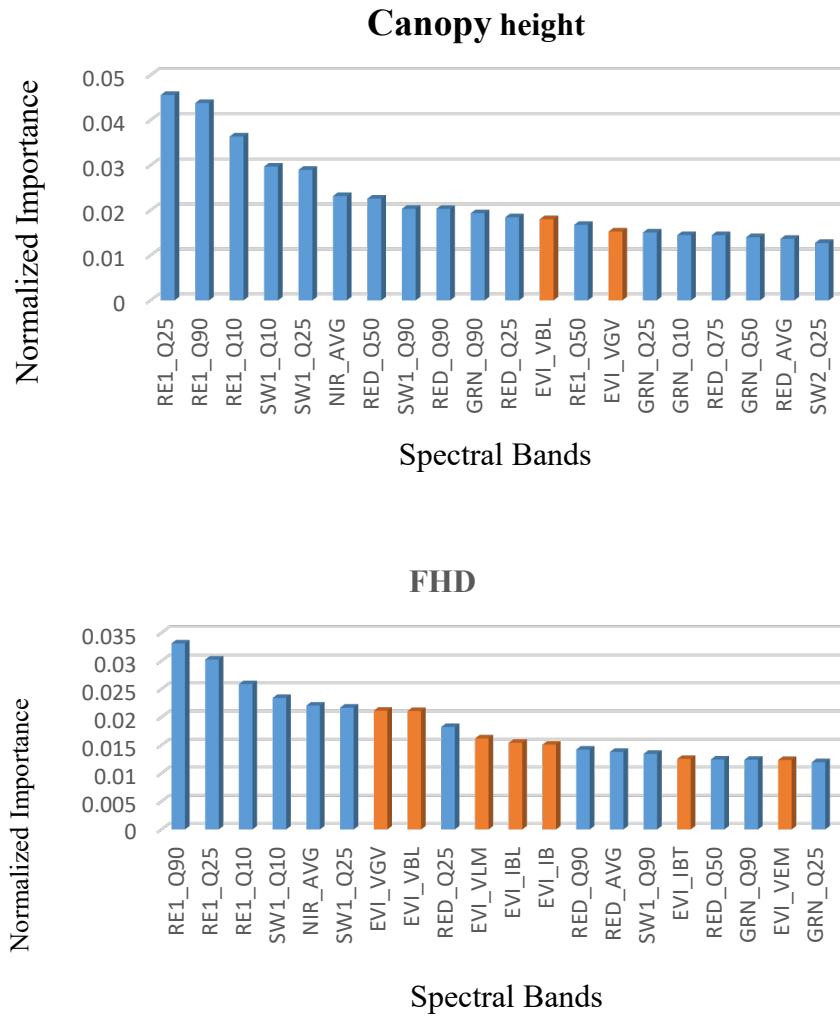

# Accuracy Total Study Area

## Total Study Area

GEDI Metrics	R <sup>2</sup>	RMSE
Canopy height	0.502	1.857
Canopy cover	0.451	0.045
FHD	0.487	0.293
PAI***	0.339	0.135

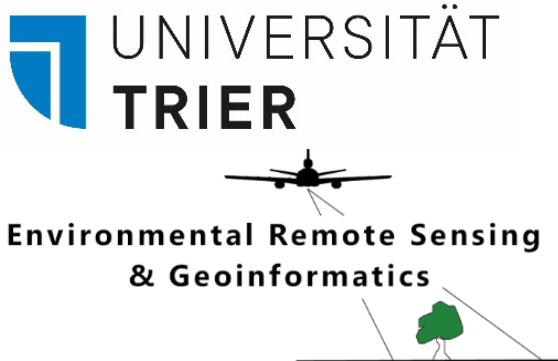

# Feature Importance, Random Forest Model

# Conclusion

- Sources of Error
  - GEDI data itself is inaccurate
  - GEDI vs. Sentinel-2 footprint (25m circle vs. 10m x10m)
  - Geolocation error
  - GEDI date and S-2 feature time frame
  - Explanatory limitation of temporal-spectral data for vertical structure data
- Is the GEDI-Sentinel2-Fusion suitable to characterize savannah ecosystems in Southern Africa?
- Originally designed for homogenous, tall and dense vegetation but seems to also provide valuable information in lower-stature, discontinuous savannah vegetation
